

Same route, same driving, same HoS rules -- why the EV finishes later

Instance RshortCfewTnone_10 (1193 km, 19 charging stations, 33 rest areas, 2 customers) | greedy policy, identical realised travel times

EV 30.68 h vs diesel 27.77 h = +2.91 h (9.5 %), all of it dwell

The EV charges 4.47 h, but HoS only mandates 2.25 h of break on this route -- so at most 2.25 h of charging can hide behind a break.

On top of the 2.22 h of exposed charging, the 0 extra pull-offs cost +0.00 h and the chargers 0.69 h of queueing.
