
Routes
Training routes
seeds 1–19 of each class
Validation routes
seeds 20–21
Test routes
seeds 22–25
the routes with their stored travel times (the ones the LA and the oracle ran on)
the same routes under new travel-time draws, run in the simulator only (no solver)
Base case
36 classes × 25 routes = 900, solved in the earlier paper. 70 routes without a feasible LA run are left out.
639 routes
of 684 with a feasible LA run
solved by LA
→ train the network and the trees on the LA's cost of every action
→ also train the two networks of the mixed-power section
same 639 routes × 2 new draws
the network drives, no solver
→ expert iteration: the rollout's comparisons are the labels
→ seeds 17–19 held out to pick the training epoch
66 routes
of 72 with a feasible LA run
solved by LA
→ stop the training of the network and the trees
→ check the rollout and each expert-iteration round
same 66 routes × 16 new draws
simulator only, no solver
→ choose the expert-iteration round (round 2)
125 routes
of 144 with a feasible LA run
solved by LA oracle greedy
→ main results: gap to the oracle and difference to the LA
same 125 routes × 16 new draws
simulator only, no solver
→ compare the learned policies with each other, more precisely
One-at-a-time variants
base routes with one change for the whole route: battery 300/700/900 kWh, chargers 150/700/1000 kW or 30/100 km apart (8 variants, 12 classes)
1,274 routes
8 variants with an LA run
solved by LA
→ train the two networks of the mixed-power section
136 routes
8 variants with an LA run
solved by LA
→ stop their training
277 routes
8 variants with an LA run
solved by LA
→ not used in the paper
Mixed powers
base routes (short and medium, 8 classes) whose chargers get different powers; on half of them, also a new spacing
238 routes
of 248 with an LA run
solved by LA
→ train the mixed-powers network
all 248 routes × 2 new draws
the network drives, no solver
→ expert iteration of that network (run, not in the paper yet)
32 routes
16 per variant
no solver run
→ not used in the paper
64 routes
oracle within 1% on 61 of them
solved by LA oracle greedy
→ results on mixed powers: gap and where energy is charged
