

Same route, same driving, same HoS rules -- why the EV finishes later

Instance RlongCfewTnone_2 (3378 km, 55 charging stations, 96 rest areas, 3 customers) | hindsight oracle (MILP optimum, gap 0.47 % / 0.00 %), identical realised travel times

EV 96.91 h vs diesel 86.97 h = +9.93 h (10.3 %), all of it dwell

The EV charges 11.10 h, but HoS only mandates 3.75 h of break on this route -- so at most 3.75 h of charging can hide behind a break.

On top of the 7.35 h of exposed charging, the 7 extra pull-offs cost +1.42 h and the chargers 1.17 h of queueing.
