

Same route, same driving, same HoS rules -- why the EV finishes later

Instance RmediumCfewTnone_11 (2236 km, 36 charging stations, 67 rest areas, 3 customers) | greedy policy, identical realised travel times

EV 59.03 h vs diesel 52.13 h = +6.90 h (11.7 %), all of it dwell

The EV charges 8.79 h, but HoS only mandates 3.75 h of break on this route -- so at most 3.75 h of charging can hide behind a break.

On top of the 5.04 h of exposed charging, the 3 extra pull-offs cost +0.50 h and the chargers 1.36 h of queueing.
