

Same route, same driving, same HoS rules -- why the EV finishes later

Instance RlongCmanyTtight_5 (3651 km, 60 charging stations, 103 rest areas, 8 customers) | greedy policy, identical realised travel times

EV 108.36 h vs diesel 96.48 h = +11.88 h (11.0 %), all of it dwell

The EV charges 15.10 h, but HoS only mandates 6.75 h of break on this route -- so at most 6.75 h of charging can hide behind a break.

On top of the 8.35 h of exposed charging, the 3 extra pull-offs cost +0.50 h and the chargers 3.03 h of queueing.
